

# **The Extreme introvert-extrovert model**

**Deepak Dhar**

**IISER, Pune**

We consider a dynamical network where agents can add or delete links to other agents, if they are not having their preferred number of links. This model has an interesting steady state, which becomes related to Ising model on a square lattice where the hamiltonian depends only on the row and column sums of spins. We will also discuss the case where agents add/delete links depending on the degree of node at the other end. These cases show interesting behavior.
